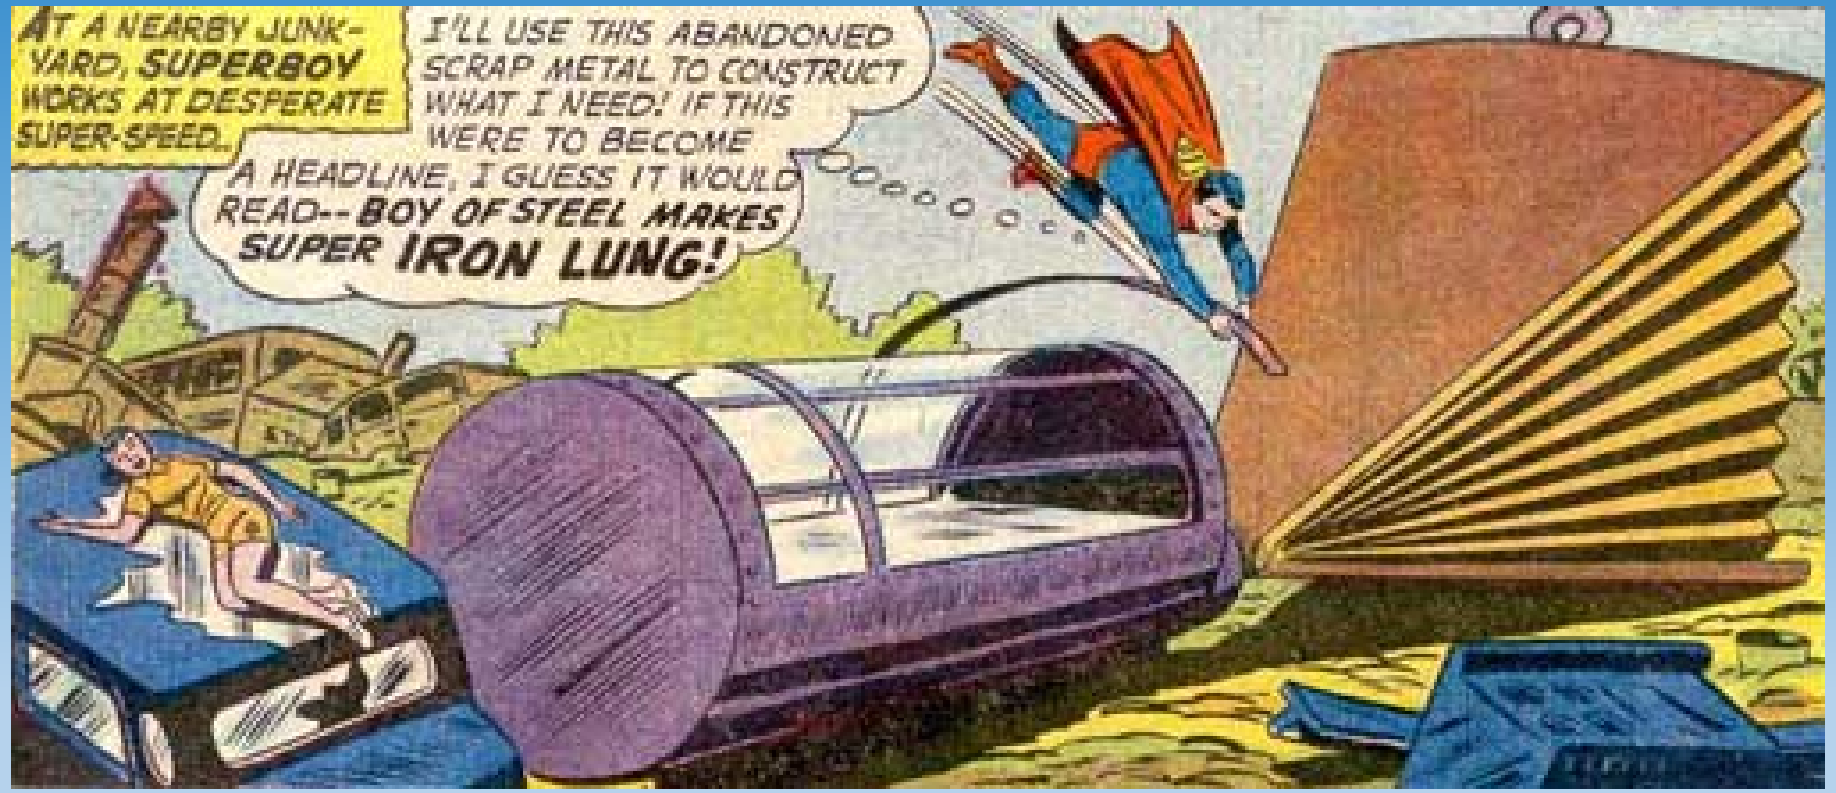
Prise en charge en kinésithérapie respiratoire des patients atteints de pathologies neuromusculaires: moyens et techniques à disposition des libéraux face aux limites en présence

Pierre LE CAM

Service de Réanimation Médicale et d'Assistance Respiratoire.

Hôpital de la Croix-rousse, GHN, Lyon

AKCR 2017



AT A NEARBY JUNK-YARD, SUPERBOY WORKS AT DESPERATE SUPER-SPEED..
I'LL USE THIS ABANDONED SCRAP METAL TO CONSTRUCT WHAT I NEED! IF THIS WERE TO BECOME A HEADLINE, I GUESS IT WOULD READ-- BOY OF STEEL MAKES SUPER IRON LUNG!

Les objectifs de la prise en charge respiratoire

La prise en charge respiratoire s'appuie sur les bilans respiratoires. Elle s'adapte aux besoins de la personne. Elle est réajustée lorsque la situation évolue. La prise en charge respiratoire s'intègre dans la prise en charge pluridisciplinaire (orthopédique, cardiologique, chirurgicale…).

OBJECTIFS

- Limiter les conséquences de l'atteinte musculaire sur la fonction respiratoire
- Limiter les facteurs aggravants
- Compenser le déficit des muscles respiratoires

Pour se sentir mieux au quotidien

Préserver la pompe respiratoire

- Maintenir ses propriétés mécaniques (mobilité, souplesse…)
- Favoriser la croissance des poumons et du thorax

→ **Kinésithérapie respiratoire**

→ **Hyperinsufflations, ventilation mécanique**

Désencombrer l'appareil respiratoire pour dégager les voies respiratoires

→ **Désencombrement bronchique : drainage bronchique et toux assistée**

Aider à respirer (restaurer la ventilation)

→ **Ventilation mécanique assistée :**
- **ventilation non invasive (VNI)**
- **ventilation invasive (par trachéotomie)**

Quality of Life, Physical Disability, and Respiratory Impairment in Duchenne Muscular Dystrophy

AJRCCM 2005

Malcolm Kohler, Christian F. Clarenbach, Lukas Böni, Thomas Brack, Erich W. Russi, and Konrad E. Bloch

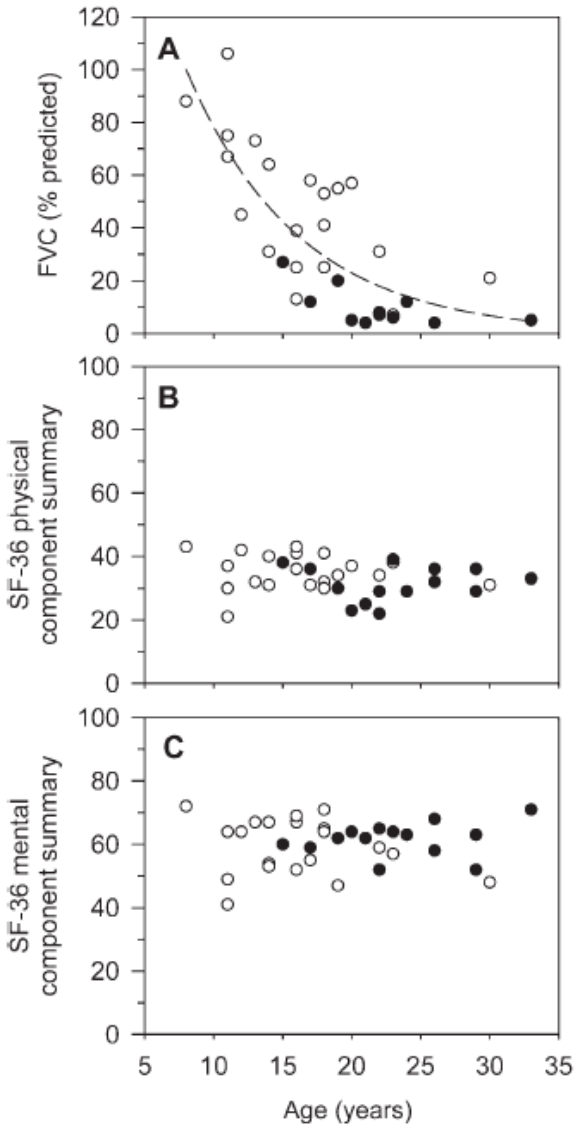


Figure 3. Respiratory impairment, represented by FVC values, progresses with advancing age. (*A*) The *dashed line* represents an exponential decay function ($f = a \cdot e^{-b \cdot time}$). There is little variation in the physical as well as in the mental component summaries of the SF-36 questionnaire (*B* and *C*, respectively). *Open circles*, patients without NIPPV; *closed circles*, patients with NIPPV.

35 pt (8-33 ans)

VNI = 14

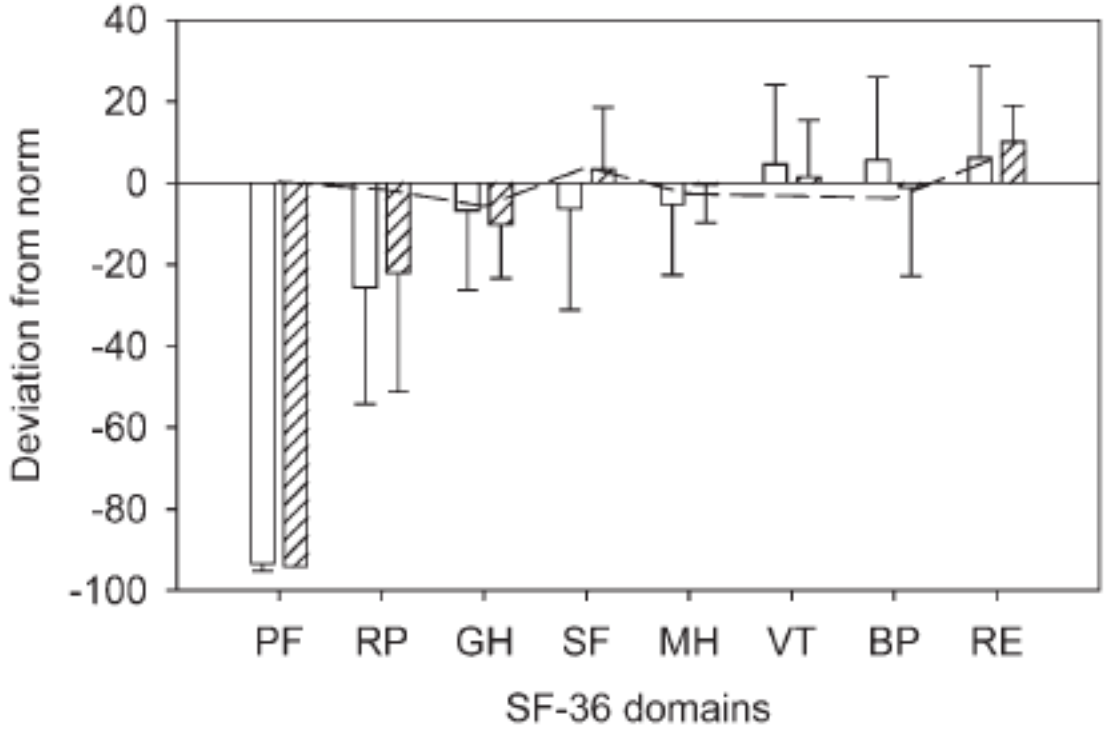

Figure 2. For each of the Short-Form 36 (SF-36) domains, the mean deviation (and SD) from sex- and age-matched U.S. reference values is displayed for 21 patients with Duchenne muscular dystrophy (DMD) without NIPPV (*open bars*), and for 14 patients with NIPPV (*hatched bars*). The *dashed line* represents the deviations of a German male reference population (20) from the U.S. reference (18). BP = bodily pain; GH= general health; MH = mental health; PF = physical functioning; RE = role-emotional; RP = role-physical; SF = social functioning; VT = vitality.

Kohler *AJRCCM* 2005

Sleep and breathing in neuromuscular disease

Eur Respir J 2002; 19: 1194–1201

S.C. Bourke, G.J. Gibson

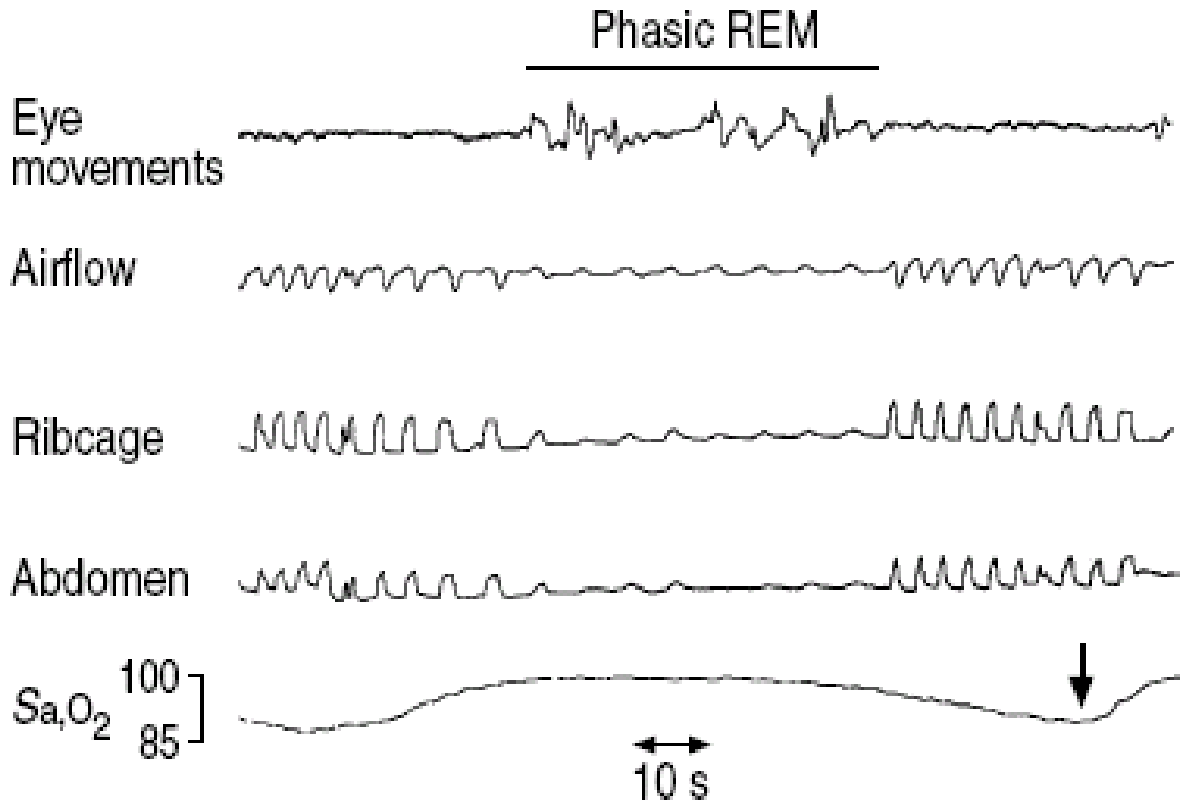

Fig. 2.–Suppression of airflow, chest and abdominal movement during tonic and phasic rapid eye movement (REM). Phasic REM is identified by the burst of rapid eye movements, and indicated by a bar. The consequent reduction in the arterial oxygen saturation (Sa,O_2) is indicated by the arrow.

Kyphoscoliosis	71 (20)	72 (17)	91 (26)	0.12	63 (26)	80 (46)	90 (36)	0.25

Mechanisms of improvement of respiratory failure in patients with restrictive thoracic disease treated with non-invasive ventilation

A H Nickol, N Hart, N S Hopkinson, J Moxham, A Simonds, M I Polkey

Thorax 2005;60:754–760. doi: 10.1136/thx.2004.039388

Amélioration du drive respiratoire

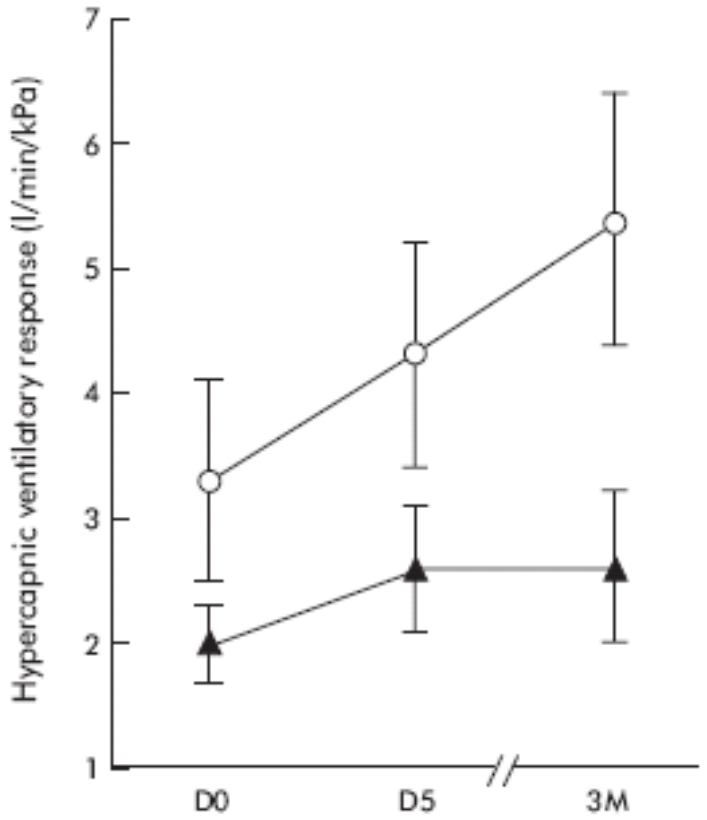

Figure 2 Effect of NIV on hypercapnic ventilatory response (HCVR) in patients with neuromuscular weakness (open circles) and kyphoscoliosis (closed triangles). Mean (SE) HCVR at day 0 (D0), day 5 (D5), and 3 months (3M) is shown. For the group as a whole there was a significant rise in HCVR ($p = 0.04$).

Indications de ventilation

Épisodes aigus

- Décompensation respiratoire aigue révélant la maladie ou d'une MNM sans évaluation respiratoire
- DRA chez patient NM connu et suivi

Indications de ventilation

Mise en route programmée

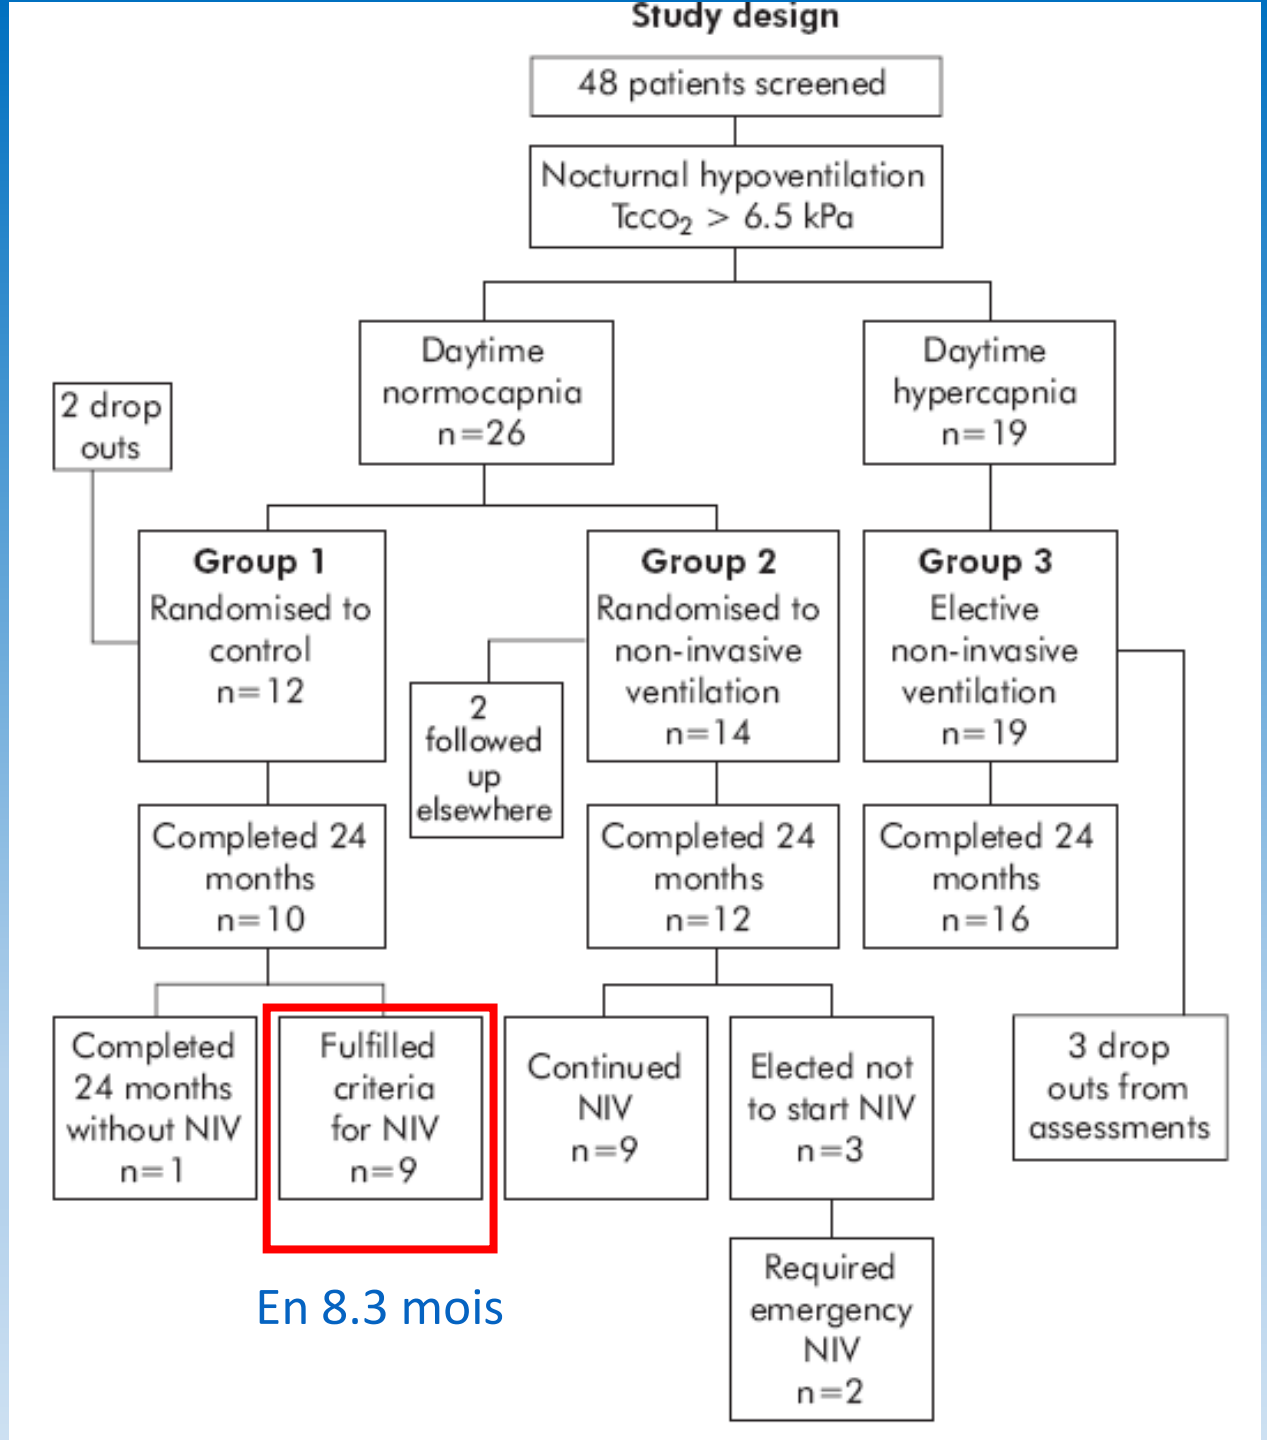
- Existence de **signes cliniques** (dyspnée, orthopnée, céphalées, asthénie, somnolence diurne, troubles du sommeil, amaigrissement, encombrement récidivant malgré aide à la toux…)
- Au moins **1** des **critères objectifs**

– paCO2 > 45 mmHg

– Désaturation nocturne < 88 % + de 5 minutes consécutives

– Hypercapnie nocturne ptcCO2 > 6,5 kPa pour pic

– CV ?



En 8.3 mois

Ward *Thorax* 2005

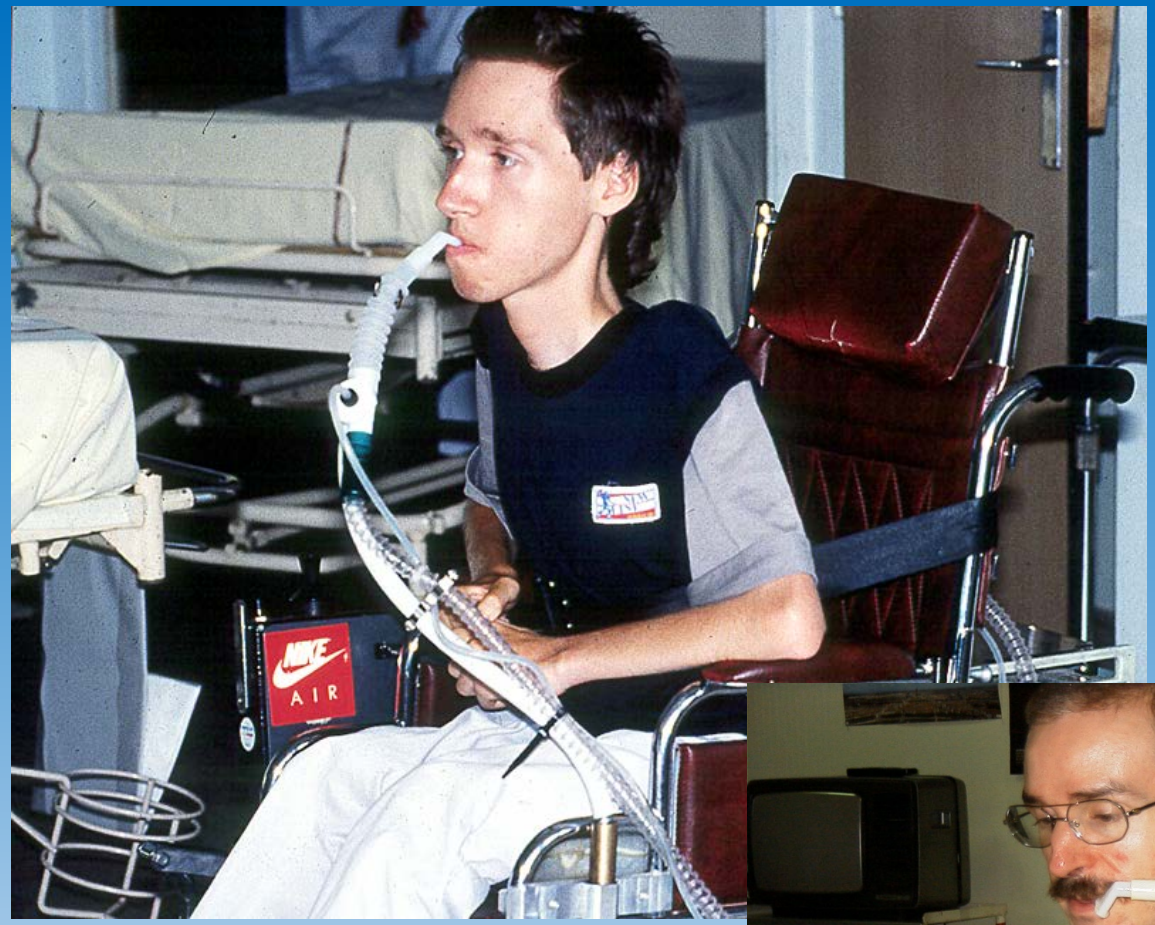
Table 1—*Possible Indications for NIV Support in NMD Patients*

When to Start NIV?
Possibilities
To prevent respiratory decompensation
To alter chest wall/lung growth characteristics
During intercurrent chest infections
For perioperative period/gastric tube placement
During pregnancy
To rest respiratory muscles
To control nocturnal hypoventilation with or without symptoms
To treat established hypercapnic ventilatory failure
To palliate symptoms/end-of-life care

Simonds *Chest* 2006

Aspects pratiques en VNI

- D'abord nocturne. Diurne si pCO2 diurne > 45
- Mode ventilatoire préférentiel ?
- Subtilités ? Fréquence respiratoire
- Interfaces: nasal +++, masque moulé vs commerce ?, pipette, MNB en chronique ? ?
- Contrôle: au mieux polygraphie , GDS réveil, ± ptcCO2
- Objectifs en pratique:
  - Clinique: ↓ symptômes, bon sommeil, bonne tolérance
  - Paracliniques: normalisation SaO2 nocturne, et GDS nocturne et diurne.



Ventilation à la pipette

Efficace

Les limites

- Connaissance
- Évaluation encombrement: difficile
- Matériel disponible (ventilation et kiné)
- Le patient lui-même:

- dépendance ventilatoire
- Efficacité de la technique de désencombrement (pas reproductible)
- Efficacité de la ventilation

En chronique ≠ en aigu

***Table 2** Factors influencing NIPPV tolerance (multivariate logistic regression)*

Variable	Odds ratio (95% CI)	*p* Value
Age at NIPPV	1.01 (0.97–1.04)	0.649
ALS-FRS score	1.04 (0.96–1.12)	0.290
Mild/moderate bulbar symptoms	6.09 (1.18–31.52)	0.031*
PEG placement	0.52 (0.18–1.55)	0.092

* Significant ($p < 0.05$)

NIPPV = noninvasive positive-pressure ventilation; ALS-FRS = ALS Functional Rating Scale; PEG = percutaneous endoscopic gastrostomy.

***Table 3** Multivariate analysis (Cox model) showing independent predictors of survival after initiation of NIPPV in the overall group of patients*

Variable	Risk ratio (95% CI)	*p* Value
NIPPV use ≥4 h/day	0.32 (0.13–0.78)	0.013*
FVC% slope after NIPPV	0.78 (0.65–0.94)	0.010*

* Significant ($p < 0.05$).

NIPPV = noninvasive positive-pressure ventilation; FVC% = forced vital capacity (percentage of predicted).

Alternatives to Endotracheal Intubation for Patients with Neuromuscular Diseases

Servera E, Sancho J, Zafra MJ, Catalá A, Vergara P, Marin J: Alternatives to endotracheal intubation for patients with neuromuscular diseases. Am J Phys Med Rehabil 2005;84:851–857.

- 17 patients (11 SLA + 4 Duchenne)
- prospective
- En IRA
- VNI en VAC, continue (pipette + nasal) et In-Exsufflation
- Atteinte bulbaire: mauvais PNT
- Bons objectifs pour contrôle hématose

Alternatives to Endotracheal Intubation for Patients with Neuromuscular Diseases

Servera E, Sancho J, Zafra MJ, Catalá A, Vergara P, Marín J: Alternatives to endotracheal intubation for patients with neuromuscular diseases. Am J Phys Med Rehabil 2005;84:851–857.

- Succès = 79,2% (ni IOT ni décès)
- Échec: 20,8 % (5 SLA dont 1 arrêt cardiaque, 1 palliatif)
- Si comparaison autres études: ↓ mortalité et ↓ séjour hospitalier

Extubation of Patients With Neuromuscular Weakness : A New Management Paradigm

John Robert Bach, Miguel R. Gonçalves, Irram Hamdani and Joao Carlos Winck

Chest 2010

113 pt New J
44 pt Portugal

Exclusion SLA bulbaire

Table 2—*Demographic Data*

Characteristics	Group 1[a]	Group 2[b]	Group 3[c]	Total
Subjects, No. (%)	74 (47)	45 (29)	38 (24)	157 (100)
Sex, No. (%)	52 male (70)	28 male (62)	17 male (45)	97 male (62)
	22 female (30)	17 female (38)	21 female (55)	60 female (38)
Diagnoses, No. (%)	ICUMy, 15 (20)	SMA, 10 (22)	SMA, 10 (26)	SMA, 25 (16)
	SCI, 13 (18)	MD, 9 (20)	DMD, 9 (24)	MD, 22 (14)
	ALS, 11 (15)	DMD, 8 (18)	MD, 5 (13)	DMD, 20 (13)
	MG, 9 (12)	MG, 6 (13)	PPS, 5 (13)	SCI, 17 (11)
	MD, 8 (11)	PPS, 4 (9)	oNMD, 4 (11)	ALS, 16(10)
	oNMD, 8 (11)	oNMD, 4 (9)	SCI, 3 (8)	oNMD, 16 (10)
	SMA, 5 (7)	ALS, 3 (7)	ALS, 2 (5)	ICUMy, 15 (10)
	DMD, 3 (4)	SCI, 1 (2)	. . .	MG, 15 (10)
	PPS, 2 (3)	. . .	. . .	PPS. 11 (7)
Use of NIV preintubation, No. (%)	No NIV, 51 (69)	No NIV, 24 (53)	No NIV, 21 (55)	No NIV, 96 (61)
	Cont, 10 (14)	Cont, 7 (16)	Cont, 3 (8)	Cont, 20 (13)
	Noct, 13 (17)	Noct, 14 (31)	Noct, 14 (37)	Noct, 41 (26)

ALS = amyotrophic lateral sclerosis; Cont = continuous noninvasive ventilation; DMD = Duchenne muscular dystrophy; ICUMy = ICU-acquired neuromuscular disease; MD = muscular dystrophy; MG = myasthenia gravis; NIV = noninvasive ventilation; Noct = nocturnal noninvasive ventilation; oNMD = other neuromuscular disease; PPS = postpolio syndrome; SCI = spinal cord injury; SMA = spinal muscular atrophy, including types 1, 2, and 3, and other neuromuscular disease.

[a]Local patients.

[b]Patients transferred after failing extubations in other institutions.

[c]Patients transferred after failing multiple spontaneous breathing trials in other institutions.

Extubation of Patients With Neuromuscular Weakness : A New Management Paradigm

John Robert Bach, Miguel R. Gonçalves, Irram Hamdani and Joao Carlos Winck

Chest 2010

VNI continue + MAC (tout intervenant)

172 extubations pour 157 pt

-PCF > 160 l/min: 98 succès (100 %)

-PCF < 160 l/min: 59 sur 74 (80 %) = succès dont 52 /60 dès 1er essai

-1 SLA et 1 FSH trachéo

-131/ 157 vivants

-Connaissance VNI + MAC avant IOT facilite sevrage

Quand proposer la trachéotomie ?

- VAD inefficace: hypercapnie sévère sous VNI (fuites buccales, pipette inefficace…), dysfonction glottique
- Troubles de déglutition sévères et compliqués
- Épisodes de décompensations respiratoires aigus récurrents ?
- Dépendance ventilatoire totale et intolérance interface (lésions cutanées…) ?
- Décision anticipée et réfléchie

Ventilation par trachéotomie

- Permet une ventilation assistée totale, avec un circuit étanche
- La canule de trachéotomie protège l'arbre respiratoire de l'encombrement salivaire et permet l'aspiration directe des sécrétions
- Permet aussi une ventilation ballonnet dégonflé
